Weihang (Charles) Ding

Mountain View, CA, USA · dingcharles@berkeley.edu · +1 510-717-3464
charlesdingd.github.io · github.com/Charlesdingd · Google Scholar · LinkedIn

Research Interests

- Agent Evaluation
- Human–AI Interaction
- Self-Improving AI Agents
- Semantic Routing
- Inference Optimization

Education

University of California, Berkeley Aug. 2025 – Aug. 2026
Master of Analytics (Machine Learning), College of Engineering *GPA 3.86/4.0*

- Coursework: CS 294 Agentic AI (A); INDENG 242A/242B Machine Learning and Data Analytics I & II (A, A+).

University of Birmingham Sep. 2021 – Jun. 2025
BSc in Applied Mathematics with Information Computing Science, First Class Honours *GPA 4.0/4.0*

Research Experience

Stanford Graduate School of Business, AIM-Lab Oct. 2025 – May 2026
Research Assistant *Stanford, CA*

- Built a high-concurrency LLM benchmarking pipeline evaluating 7 models over 300K+ API calls in a 3-month longitudinal study under varied prompt constraints.
- Measured LLM-as-a-judge reliability: quantified position, verbosity, and self-preference bias in automated scoring and evaluated debiasing methods for each effect.
- Built trustingdata.ai, a full-stack research platform on Google Cloud supporting Stanford GSB and Wharton studies of human–LLM and human–agent interaction.

University of Birmingham Nov. 2022 – Apr. 2025
Undergraduate Researcher

- **BroadDiff**: combined graph diffusion with the Broad Learning System to capture long-range node information while avoiding the overfitting of graph convolution; validated on multi-stage Alzheimer's disease classification. [Pub. 3]
- **GDRBN**: Graph Diffusion Regularized Broad Network with Hippo-algorithm hyperparameter search for visual recognition on ImageNet (Oct. 2024 – Apr. 2025).
- **VeriBypasser**: led a 5-person team to build a CNN-based CAPTCHA recognition system (85.2% accuracy) and a CAPTCHA generator with controllable distortion; assessed the risk of weak CAPTCHA schemes. [Pub. 4]

Industry Experience

GMI Cloud (NVIDIA Preferred Partner) May 2026 – Present
Machine Learning Engineer *Silicon Valley, CA*

- Core member of **VeriLoops**, a loop-engineering effort led by a former chief AI scientist at Oracle, working on rapid model deployment, automated inference optimization, and the validation of both.
- Led the GMI Router, an LLM router predicting per-query quality and cost across models. Against GPT-5.5 alone, balanced mode cuts cost 79% at equal quality and quality mode cuts cost 31% at 2.5% higher quality; both score over 10% above the OpenRouter Auto Router.
- Designed the dynamic model escalation experiment on the Terminus 2 and Claude Code harnesses: start on a 26× cheaper model, escalate on live failure signals, and carry the transcript and working tree across the switch. Recovered 3 of 9 Terminal-Bench 2.1 tasks that had failed in all 10 prior runs.
- Showed that the harness, not only the task, decides which tasks need the stronger model (0.35 Jaccard overlap across harnesses), making harness identity a routing input.
- Built a 12-benchmark, 21-model evaluation suite with 90K+ graded responses using rule checkers, sandboxed code execution, and an LLM-judge panel.
- Deployed an NVFP4-quantized Nemotron-3-1B embedding model on 8× Blackwell 5090 GPUs with vLLM: 3× throughput at 1.5M input tokens/s with no observable quality loss.

Tencent (the company behind WeChat) Apr. 2025 – Aug. 2025
Forward Deployed Engineer *Shenzhen, China*

- Fine-tuned Qwen3 models with full-parameter, LoRA, and QLoRA SFT in LLaMA-Factory; served with vLLM.
- Built a knowledge-distillation pipeline with distributed DeepSeek-R1 as teacher to fine-tune Llama-3.2-3B, raising GSM8K accuracy from 70% to 77%.
- Developed a cloud GRPO reinforcement-learning workflow with veRL and Qwen3-8B, packaged as reusable skills for data preparation, distributed training, and serving.

Elsevier Nov. 2024 – Apr. 2025
Data Science Intern *Beijing, China*

- Analysed large-scale scholar and publication data to identify research trends in computer science, environmental science, and materials science; supported THE World University Subject Rankings.
- Built Python pipelines to clean and integrate multi-source bibliometric datasets and derive features for statistical modeling of emerging research topics.
- Built interactive dashboards and automated reporting pipelines in Tableau and Python for research and business stakeholders.

Open-Source Contributions

- **Terminal-Bench Science** (task author, PR #2254, proposal approved and domain review passed, final review pending): an operations-research task in which an agent must plan admissions, rooms, and discharges for 450–500 patients across 70–80 beds under 13 constraints, estimate readmission-risk curves from confounded records, and hand in a branch-and-bound certificate within 1% of optimum (or an infeasibility certificate) that the verifier re-solves leaf by leaf. Frontier agents (Claude Opus 5.5, GPT-6) pass at most 2 of 4 runs.

Selected Projects

- **trustingdata.ai**: platform for human-in-the-loop multimodal and agentic AI evaluation (Stanford GSB AIM-Lab).
- **quantdesk**: LLM-driven alpha-mining loop for WorldQuant BRAIN with Thompson sampling over archived candidates and an auditable lineage archive.

Academic Service

- Reviewer: EMNLP 2026 Industry Track; AAAI 2027; NeurIPS 2026 workshops.

Honors & Awards

- Meritorious Winner, Mathematical Contest in Modeling (MCM), COMAP, USA, 2023.
- Honorable Mention, Mathematical Contest in Modeling (MCM), COMAP, USA, 2022.

Technical Skills

Languages	Python, C++, Go
ML & LLMs	PyTorch, vLLM; SFT, LoRA/QLoRA, knowledge distillation, GRPO/RLHF, RAG; agent evaluation, benchmark design
Inference optimization	Quantization, speculative decoding, constrained decoding
Systems	Git, Docker, Kubernetes, CI/CD, CUDA, Google Cloud
